Harshitha Chittapragada

AI Product Engineer - Founder of Agent Mag

Hyderabad, Telangana, India / chittapragadaharshitha@gmail.com / +91 70138 47174 / harshitha.dev / LinkedIn / GitHub

CURRENT
Founder and AI Product Engineer at Agent Mag

FOCUS
AI products, agent systems, automation, operations

OPERATING BASE
Hyderabad, India

AI product engineer and founder who turns ambiguous operating problems into products people can use and teams can run. Works across discovery, requirements, roadmap definition, agent and workflow architecture, AI-assisted implementation, integrations, deployment, and production follow-through. Brings particular strength to systems where model reasoning must coexist with permissions, durable state, human approval, provider failures, and clear operator control.

OPERATING THESIS

Design the boundary.
Build the workflow.
Operate the result.

86 PRODUCT PAGES IN THE REVIEWED AGENT MAG PLATFORM

62 API ROUTES ACROSS THE PRODUCT SURFACE

492 PUBLIC INSTALLABLE AGENT SKILL BUNDLES

16 DELIVERY, SYNC, RELEASE, AND REVIEW WORKFLOWS

Founder-led AI product work

Agent Mag - Founder and AI Product Engineer

Q1 2026 – PRESENT

Agent platform - open builder ecosystem - governed operations runtime

- Founded and leads a connected product family for AI-agent builders and operations teams: an 86-page public platform, Agent Mag AI, a 492-skill open registry and CLI, and a governed automation runtime.
- Owns product direction across roadmap definition, agent experience, workflow design, integrations, launch surfaces, and the operating details required to move from prototype to dependable use.
- Implemented Azure OpenAI streaming and a multi-step function-calling loop with structured tool-result blocks, then connected the agent experience to an OpenClaw gateway with model routing and identity controls.
- Defined a governed operating model in which agents investigate, extract, and draft while typed workflows, approval gates, provider adapters, and persistent records control consequential actions.
- Built distribution around an inspectable skills ecosystem, product catalog, documentation, public GitHub repositories, and an npm CLI rather than treating agent capabilities as private prompt files.
- Uses Claude Code and Codex as implementation tools while retaining responsibility for requirements, system boundaries, debugging, testing, deployment, and human-control points.

31 REVIEWED DATABASE MIGRATIONS

17 PROVIDER INTEGRATION MODULES

16 REUSABLE WORKFLOW BLOCKS

4 DEPLOYABLE PRODUCT SURFACES

Professional value

PRODUCT OWNERSHIP

Turns operating needs into buildable systems

- Clarifies users, decisions, data, failure modes, and measurable acceptance criteria before implementation.
- Connects product scope to agent behavior, integrations, interfaces, deployment, and ongoing operations.
- Documents systems so collaborators can understand what is automated, what remains human, and why.

IMPLEMENTATION JUDGMENT

Builds for control, recovery, and handoff

- Separates probabilistic model work from deterministic execution, permissions, and audit state.
- Designs retries, idempotency, approval paths, restart recovery, and provider-specific failure handling.
- Tests end-to-end workflows and leaves infrastructure, credentials, and operating control with the owner.

Experience and selected record

AI PRODUCT / AGENT SYSTEMS
COMMUNITY / SOFTWARE DELIVERY

Product, engineering, and community

Agent Mag - Founder and AI Product Engineer

Q1 2026 - PRESENT

AI-agent platform - open ecosystem - production operations

- Turns feedback from builders and operators into a prioritized roadmap spanning discovery, agent interaction, reusable capabilities, integrations, documentation, and operational tooling.
- Runs product operations across public and access-controlled surfaces: release checks, workflow validation, demo paths, documentation quality, identity controls, and deployment follow-through.
- Balances ecosystem growth with product governance by keeping skill packages inspectable, provider credentials server-side, and consequential actions behind explicit control points.
- Maintains the public product and founder record across agentmag.dev, the Agent Mag GitHub organization, technical case studies, and implementation documentation.
- Uses observed workflow failures and operator questions to refine requirements, system boundaries, acceptance checks, and the next release rather than treating deployment as the end of product work.

Google - Student Ambassador

AUG 2025 - PRESENT

Campus technology education - peer mentoring - ecosystem outreach

- Selected to represent Google technologies in the student community through workshops, technical sessions, peer mentoring, and campus outreach.
- Organizes practical learning sessions that help students explore Google tools and emerging technologies and connects peers with wider technical opportunities.
- Builds confidence translating technical concepts for mixed-skill audiences and turning community feedback into useful learning sessions.

Executive Software Guild India Pvt Ltd - Software Developer Intern

OCT 2025 - NOV 2025

Requirements - backend review - testing - relational data

- Translated business needs and software processes into clear technical requirements and implementation-oriented documentation.
- Reviewed backend code, identified quality and consistency issues, executed test cases against specifications, and supported SQL and relational-database work.
- Worked across requirements, implementation review, and validation rather than treating documentation and testing as separate downstream activities.

DREP Software Solutions Pvt Ltd - AI Development Engineer Intern

AUG 2025 - OCT 2025

AI-agent evaluation - workflow analysis - performance documentation

- Worked with architects and senior developers to analyze existing AI-agent projects and understand production-oriented agent architectures.
- Tested and benchmarked agent functionality, accuracy, and efficiency; documented bottlenecks and contributed improvement recommendations for AI workflows.
- Built practical experience evaluating model behavior as part of a wider workflow, including inputs, tool paths, performance evidence, and operational constraints.

Infosys Springboard - Pragati: Path to Future, Cohort 3

DEC 2024 - MAR 2025

Selective 12-week programme for women in technology

- Completed applied learning in citizen data science, analysis, visualization, statistical reasoning, digital dexterity, leadership, and professional development.
- Used the programme to connect formal AI and data-science study with workplace communication, structured problem solving, and technology careers.

Community and operating range

LEADERSHIP

Technical communities

- Core Team Member, TEDx VMTW.
- Organized a three-day college festival serving 6,000+ attendees.
- Mentors peers on technology learning and career paths.

OPERATING RANGE

Cross-functional execution

- Moves between product framing, implementation, testing, documentation, deployment, and support.
- Communicates technical systems in clear operating language for users, collaborators, and decision-makers.

Contribution boundary: Platform-scale figures describe reviewed systems. Named implementation work reflects Harshitha's verified product and engineering contributions; it does not claim sole authorship of every historical module.

Selected systems and technical work

IMPLEMENTATION PATHS
RELIABILITY CONTROLS
OPERATING EVIDENCE

Production-shaped AI work

LIVE PRIVATE SYSTEM / AGENT OPERATIONS

Jarvis Multi-Agent Operations

Problem: email, calendar, and meeting work has different permissions, data shapes, and failure modes; one unconstrained agent becomes hard to trust.

- **Contribution:** designed and operates a master router with Email, Calendar, and Meeting specialists, shared memory, and chat and voice entry surfaces.
- **Engineering:** bounded Gmail, Google Calendar, and Fireflies tool paths run through durable n8n workflows on Docker and Linux.
- **Value:** new tools can be added without giving every agent unrestricted access to every account.

LIVE DEPLOYMENT / RECRUITMENT OPERATIONS

Enterprise Hiring Automation

Problem: staffing requests arrived through inconsistent Outlook threads, forwards, copied recipients, and attachments, creating slow matching and duplicate-reply risk.

- **Contribution:** built Microsoft Graph intake, full-message normalization, section-aware extraction, weighted matching, controlled replies, and persisted processing state.
- **Engineering:** 385 skill families, 1,165 aliases, 60% skill weighting, five-minute Azure intake, retries, timeouts, and restart recovery.
- **Value:** recruiters receive ranked shortlists and recoverable history without silently replying twice.

CLIENT SERVICE / SELF-HOSTED AGENTS

OpenClaw & Hermes Deployments

Problem: installing an open-source agent does not solve host security, permissions, credential custody, provider reliability, or operational handoff.

- **Contribution:** maps recurring work into permissions and acceptance checks, provisions the host, isolates the runtime, and validates providers independently.
- **Engineering:** OpenClaw or Hermes, Docker, Linux, SSH, OAuth, firewall controls, encrypted credentials, and six named integrations.
- **Value:** client-owned infrastructure and credentials, zero implementation access retained after handoff, and 14-day launch support.

CONTROLLED PUBLISHING / WORKFLOW PRODUCT

Content Automation Studio

Problem: content operations lose time across research, writing, image generation, source review, and delivery, while autonomous publishing creates trust risk.

- **Contribution:** shaped separate research-to-newsletter and research-to-carousel paths with visible progress, retained sources, citations, and explicit review.
- **Engineering:** Firecrawl, OpenAI Responses and Image, Resend, LinkedIn API, NDJSON progress, and GitHub Actions.
- **Value:** one operator can produce reviewable assets while publication remains a separate, guarded action.

Agent Mag Skills Registry and CLI

492 public skills - declarative packages - validation - catalog APIs - CLI installation

- Defined a distribution model where skills remain inspectable bundles of metadata, instructions, tool requirements, configuration, and documentation rather than opaque executable packages.
- Connected GitHub review, automated validation and synchronization, product discovery, API access, and a nine-command CLI into one contribution and installation path.
- Creates a reusable product feedback loop: builders can evaluate a capability before installation, while catalog and usage signals inform the wider Agent Mag roadmap.

Decisions repeated across the systems

Separate reasoning from authority

Models handle interpretation, extraction, classification, and drafting. Typed services and bounded tools own permissions, provider actions, approval state, and irreversible effects.

Design for interrupted execution

Persist identifiers and progress, check processing state before acting, make retries explicit, and give long-running workflows a safe restart path instead of assuming one clean run.

Treat each integration as a failure domain

Validate authentication, permissions, payload shapes, recipient rules, timeouts, and provider-specific error behavior independently; one successful login is not an operational test.

Make the operator able to explain the result

Expose sources, proposed actions, approval decisions, outputs, errors, timestamps, and recovery state so a person can reconstruct what happened and decide what happens next.

From ambiguous request to operated system

Discover the recurring job and its constraints; define users, data, permissions, and acceptance criteria; map agents, deterministic actions, and review boundaries; implement and integrate; test real failure paths; deploy with explicit ownership; document the operating model; and iterate from observed use.

> **Pattern across the work:** Harshitha adds value by connecting the model layer to the less-visible system around it: identity, state, permissions, retries, review, provider behavior, deployment, evidence, and handoff.

Capability, education and credentials

FORMAL STUDY
SELECTED CREDENTIALS
COMMUNITY CONTRIBUTION

Technical and product capability

Product definition & delivery

Discovery, requirements, roadmap definition, user journeys, acceptance criteria, product documentation, launch surfaces, stakeholder communication, and iteration from operating feedback.

Agent & knowledge systems

Agent topology, tool contracts, prompt and context design, model routing, structured outputs, RAG concepts, function calling, human review, and operator-facing interfaces.

Automation & integrations

n8n, APIs, webhooks, Microsoft Graph, Gmail, Google Calendar, Fireflies, provider hand-offs, schedules, validation, retries, failure paths, and approval gates.

Application & data

TypeScript, Next.js, Python, Java, PostgreSQL, SQL, Azure Cosmos DB, schemas, authentication, dashboards, testing, technical documentation, and Git workflows.

Cloud & deployment

Azure App Service and Functions, Docker, Linux, VPS hosting, OAuth, SSH, secrets, identity boundaries, client-owned infrastructure, and production handoff.

Reliable AI operations

Persistent state, idempotency, duplicate prevention, restart recovery, observability concepts, audit records, access boundaries, approval design, and provider-specific verification.

Formal study

B.Tech, Artificial Intelligence and Data Science

2022 - 2026

Vignan's Institute of Management and Technology for Women - Hyderabad, India

- GPA: 7.5 / 10.0.
- Coursework includes data structures and algorithms, computer architecture, networks, operating systems, database management, computational theory, and big data.

Certifications

Infosys Springboard	Pragati: Path to Future, Cohort 3 - 12-week programme covering citizen data science, digital dexterity, leadership, and industry engagement.
Udemy	MySQL Bootcamp - aggregate functions, complex queries, logical operators, string functions, and database schema design.
NPTEL	Programming in Java - 12-week course covering core Java concepts and problem solving.
IBM	Getting Started with Artificial Intelligence - foundational concepts, processes, and applications.

Leadership & achievement

Google	Selected Student Ambassador representing Google technologies through campus education, workshops, peer mentoring, and ecosystem outreach.
TEDx VMTW	Core team member supporting event execution and cross-functional coordination.
6,000+	Successfully helped organize a three-day college festival attended by more than 6,000 people.
HackerRank	Earned the Gold Level Java Badge.

Earlier technical projects

MACHINE LEARNING / ACADEMIC PROTOTYPE

Pneumonia Detection Model Comparison

Built a chest X-ray classification prototype comparing convolutional architectures and evaluation outputs. Used Python, TensorFlow, PyTorch, OpenCV, Pillow, NumPy, Pandas, and Matplotlib.

JAVA / DESKTOP APPLICATION

Currency Converter

Developed a desktop currency-conversion exercise with a user-facing Java interface using AWT and Swing, reinforcing application structure and event-driven interaction.
